

Grade 8

Adopted 2020

Standards for Mathematical Practice

- 1. Make sense of problems and persevere in solving them - Students will plan strategies to use and persevere in solving math problems. MP.1**

- 2. Reason abstractly and quantitatively - Students will think about numbers in many ways and make sense of numerical relationships as they solve problems. MP.2**

- 3. Construct viable arguments and critique the reasoning of others - Students will explain their thinking and make sense of the thinking of others. MP.3**

- 4. Model with mathematics - Students will use representations to show their thinking in a variety of ways. MP.4**

- 5. Use appropriate tools strategically - Students will use math tools such as tables, diagrams, and technology to explore and deepen their understanding of concepts. MP.5**

- 6. Attend to precision - Students will use precise mathematical language and check their work for accuracy. MP.6**

- 7. Look for and make use of structure - Students will use their current mathematical understandings to identify patterns and structure to make sense of new learning. MP.7**

- 8. Look for and express regularity in repeated reasoning - Students will look for patterns and rules to help create general methods and shortcuts that can be applied to similar mathematical problems. MP.8**

Quantitative Reasoning

The Number System

- 6. Know that there are numbers that are not rational, and approximate them by rational numbers. QR.EA.6**
 - 1. Know that numbers that are not rational are called irrational. Understand informally that every number has a decimal expansion; for rational numbers show that the decimal expansions terminate in 0s or eventually repeats and convert a decimal expansion into a rational number. 8.NS.A.1**
 - 2. Use rational approximations of irrational numbers to compare the size of irrational numbers, locate them approximately on a number line diagram, and estimate the value of expressions (e.g., π^2). 8.NS.A.2**

6. Work with radicals and integer exponents. **AR.EA.6**
 1. Know and apply the properties of integer exponents to generate equivalent numerical expressions. **8.EE.A.1**
 2. Use square root and cube root symbols to represent solutions to equations of the form $x^2 = p$ and $x^3 = p$, where p is a positive rational number. Evaluate square roots of small perfect squares and cube roots of small perfect cubes. Know that $\sqrt{2}$ is irrational. **8.EE.A.2**
 3. Use numbers expressed in the form of a single digit times an integer power of 10 to estimate very large or very small quantities, and to express how many times as much one is than the other. **8.EE.A.3**
 4. Perform operations with numbers expressed in scientific notation, including problems where both decimal and scientific notation are used. Use scientific notation and choose units of appropriate size for measurements of very large or very small quantities (e.g., use millimeters per year for seafloor spreading). Interpret scientific notation that has been generated by technology. **8.EE.A.4**
7. Understand the connections between proportional relationships, lines, and linear equations. **AR.EA.7**
 5. Graph proportional relationships, interpreting the unit rate as the slope of the graph. Compare two different proportional relationships represented in different ways. **8.EE.B.5**
 6. Use similar triangles to explain why the slope m is the same between any two distinct points on a non-vertical line in the coordinate plane; derive the equation $y = mx$ for a line through the origin and the equation $y = mx + b$ for a line intercepting the vertical axis at b . **8.EE.B.6**
8. Analyze and solve linear equations and pairs of simultaneous linear equations. **AR.EA.8**
 7. Solve linear equations in one variable. **8.EE.C.7**
 - a. Give examples of linear equations in one variable with one solution, infinitely many solutions, or no solutions. Show which of these possibilities is the case by successively transforming the given equation into simpler forms, until an equivalent equation of the form $x = a$, $a = a$, or $a = b$ results (where a and b are different numbers). **8.EE.C.7.A**
 - b. Solve linear equations with rational number coefficients, including equations whose solutions require expanding expressions using the distributive property and collecting like terms. **8.EE.C.7.B**
 8. Analyze and solve pairs of simultaneous linear equations. **8.EE.C.8**
 - a. Understand that solutions to a system of two linear equations in two variables correspond to points of intersection of their graphs, because points of intersection satisfy both equations simultaneously. **8.EE.C.8.A**
 - b. Solve systems of two linear equations in two variables algebraically (i.e. by substitution or elimination) and estimate solutions by graphing the equations. Solve simple cases by inspection. **8.EE.C.8.B**

- c. Solve real-world and mathematical problems leading to two linear equations in two variables. **8.EE.C.8.C**
-

Functions

9. Define, evaluate, and compare functions in order to model relationships between quantities. **AR.EA.9**
1. Understand that a function is a rule that assigns to each input exactly one output. The graph of a function is the set of ordered pairs consisting of an input and the corresponding output. **8.F.A.1**
2. Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions). **8.F.A.2**
3. Interpret the equation $y = mx + b$ as defining a linear function, whose graph is a straight line; give examples of functions that are not linear. **8.F.A.3**
4. Construct a function to model a linear relationship between two quantities. Determine the rate of change and initial value of the function from a description of a relationship or from two (x, y) values, including reading these from a table or from a graph. Interpret the rate of change and initial value of a linear function in terms of the situation it models, and in terms of its graph or a table of values. **8.F.B.4**
5. Describe qualitatively the functional relationship between two quantities by analyzing a graph (e.g., where the function is increasing or decreasing, linear or nonlinear). Sketch a graph that exhibits the qualitative features of a function that has been described verbally. **8.F.B.5**
-

Geometric Reasoning

Geometry

1. Solve real-world and mathematical problems involving angle measure, area, surface area, and volume. [GR.EA.1](#)
 9. Know the formulas for the volumes of cones, cylinders, and spheres and use them to solve real-world and mathematical problems. [8.G.C.9](#)
 3. Understand congruence and similarity using physical models, transparencies, or geometry software, [GR.EA.3](#)
 1. Verify experimentally the properties of rotations, reflections, and translations: [8.G.A.1](#)
 - a. Lines are taken to lines, and line segments to line segments of the same length. [8.G.A.1.A](#)
 - b. Angles are taken to angles of the same measure. [8.G.A.1.B](#)
 - c. Parallel lines are taken to parallel lines. [8.G.A.1.C](#)
 2. Understand that a two-dimensional figure is congruent to another if the second can be obtained from the first by a sequence of rotations, reflections, and translations; given two congruent figures, describe a sequence that exhibits the congruence between them. [8.G.A.2](#)
 3. Describe the effect of dilations, translations, rotations, and reflections on two-dimensional figures using coordinates. [8.G.A.3](#)
 4. Understand that a two-dimensional figure is similar to another if the second can be obtained from the first by a sequence of rotations, reflections, translations, and dilations; given two similar two-dimensional figures, describe a sequence that exhibits the similarity between them. [8.G.A.4](#)
 5. Use informal arguments to establish facts about the angle sum and exterior angle of triangles, about the angles created when parallel lines are cut by a transversal, and the angle-angle criterion for similarity of triangles. [8.G.A.5](#)
 4. Understand and apply the Pythagorean Theorem. [GR.EA.4](#)
 6. Explain a proof of the Pythagorean Theorem and its converse using pictures, diagrams, narratives or models. [8.G.B.6](#)
 7. Apply the Pythagorean Theorem to determine unknown side lengths in right triangles in real-world and mathematical problems in two and three dimensions. [8.G.B.7](#)
 8. Apply the Pythagorean Theorem to find the distance between two points in a coordinate system. [8.G.B.8](#)
-

Statistical Reasoning

Statistics & Probability

4. Investigate patterns of association in bivariate data. **SR.EA.4**
 1. Construct and interpret scatter plots for bivariate measurement data to investigate patterns of association between two quantities. Describe patterns such as clustering, outliers, positive or negative association, linear association, and nonlinear association. **8.SP.A.1**
 2. Know that straight lines are widely used to model relationships between two quantitative variables. For scatter plots that suggest a linear association, informally fit a straight line, and informally assess the model fit by judging the closeness of the data points to the line. **8.SP.A.2**
 3. Use the equation of a linear model to solve problems in the context of bivariate measurement data, interpreting the slope and intercept. **8.SP.A.3**
 4. Understand that patterns of association can also be seen in bivariate categorical data by displaying frequencies and relative frequencies in a two-way table. Construct and interpret a two-way table summarizing data on two categorical variables collected from the same subjects. Use relative frequencies calculated for rows or columns to describe possible association between the two variables. **8.SP.A.4**
